e-riv
safe shipping pack

High quality raw materials

E-riv is made of plywood and is recognizable by the absolute quality of processing and raw materials, which are strictly controlled and directly imported from the main producing countries. Birch plywood, 6 mm thick, 5 layers, offers maximum strength, flexibility and durability. Compared to the traditional crate made of fir boards or other types of wood, **E-riv** offers: greater protection against atmospheric agents, highest safety level, because it stands thermal excursions and does not crack, greater mechanical resistance and full compliance with ISPM-15 FAO international phytosanitary standards.

A practical and robust packaging

The **E-riv** box consists of just three parts: cover, central body made up of four panels joined by a special metal angle, base to facilitate the mechanical lifting of the crate. The assembly, facilitated by a system of joints between the parts, is extremely simple and fast.

*Customizable with hooks,
handles and/or hinges*

E-riv pallets

- Bottom plate made of plywood
- Wooden bottom full or open
- 2 or 4 way
